

Wuhan-coronavirus homologue map

Kou Amano

Background and Objective

Background: At the beginning of 2020, global risk of infection of coronavirus is spreaded. The pandemic started in 2019 and governments announced a state of emergency. In Japan, the government adopted PCR as a diagnosis method of the infection. But the selection of primers influence the accuracy greatly.

Objective: Therefor, I provide a "map" of homological region of coronavirus to other viruses and animals to help the primer design.

Method

blast
DB: makeblastdb -in <<input file>> -out <<DB name>> -dbtype nucl -parse seqids
Query: megablast -d <<DB name>> -i <<query sequence>> -W 10 > <<output file>>

self-blast
Fragmentation: fragment bf=<<input file>> S=25 G=25 cs=1 > <<output file>>
DB: same as above.
Query: same as above.

window-fourrier
Fragmentation: 30 fragments – 1000 bases
Conversion: "A" -> 1, "T" -> -1, "G" -> I, "C" -> -I
Fourier transform: $Ft(\text{each fragment})$

selection of frequent homologues
Vertebrate: base-hit count >= 5; seq-lenght >= 5
Viruses: base-hit count >= 18; seq-lenght >= 5
