Wuhan-coronavirus homologue map

Background and Objective

Background: At the beginning of 2020, global risk of infection of coronavirus is spreded. The pandemic started in 2019 and governments announced a state of emergency. In Japan, the government adopted PCR as a diagnosis method of the infection. But the selection of prmers influences the accuracy greatly. Objective: Therefor, I provide a "map" of homological region of coronavirus genome to other viruses and annimals genomes to help the primer design.

Method

BLAST

DB: makeblastdb -in <<input file>> -out <<DB name>> -dbtype nucl -parse_seqids Query: megablast -d <<DB name>> -i <<query sequence>> -W 10 > <<output file>>

in CDS

Self-BLAST

Fragmentation: fragment bf=<<input file>> S=25 G=25 cs=1 > <<output file>> DB: same as above. Query: same as above.

Window-fourrier

Fragmentation: 30 fragments; 1000 bases / fragment Conversion: "A" -> 1, "T" -> -1, "G" -> I, "C" -> -I Fourier transform: Ft (<< each fragment>>)

Selection of frequent homologues Vertebrates: base-hit count >= 5; seq-lenght >= 5

Viruses: base-hit count >= 18; seq-lenght >= 5
